^{*}Accurate R_{DS(on)} test at die level is not feasible for this thin die as limited by the test contact precision attainable in a die form. The max R_{DS(on)} specification is defined from the historical performance of the die in package but is not guaranteed by test in production. The die R_{DS(on)} performance depends on the Source wire/ribbon bonding layout.

$R_{ heta JA}$	Maximum Thermal Resistance, Junction to Ambient (Note 3)	43	°C/W

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- 1. Current is limited by silicon.
- 2. Starting $T_J = 25^{\circ}C$, $L = 30 \,\mu\text{H}$, $I_{AS} = 79 \,\text{A}$, $V_{DD} = 100 \,\text{V}$ during inductor charging and $V_{DD} = 0 \,\text{V}$ during time in avalanche. 3. $R_{\theta JA}$ is the sum of the junction–to–case and case–to–ambient thermal resistance, where the case thermal reference is defined as the solder mounting surface of the drain pins. $R_{\theta JC}$ is guaranteed by design, while $R_{\theta JA}$ is determined by the board design. The maximum rating presented here is based on mounting on a 1 in² pad of 2oz copper.
