A. The value of  $R_{0,IA}$  is measured with the device mounted on  $1 \text{in}^2$  FR-4 board with 2oz. Copper, in a still air environment with  $T_A$  =25° C. The Power dissipation P<sub>DSM</sub> is based on R <sub>0JA</sub> t≤ 10s and the maximum allowed junction temperature of 175 °C. The value in any given application

depends on the user's specific board design, and the maximum temperature of 175 $^{\circ}$  C may be used if the PCB allows it. B. The power dissipation P<sub>D</sub> is based on T<sub>J(MAX)</sub>=175 $^{\circ}$  C, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heatsinking is used.

C. Single pulse width limited by junction temperature  $T_{J(MAX)}$ =175 $^{\circ}$  C.

D. The R<sub>0JA</sub> is the sum of the thermal impedance from junction to case R<sub>0JC</sub> and case to ambient.

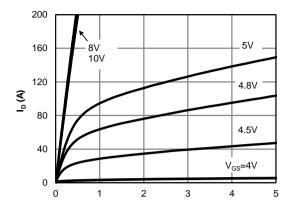

E. The static characteristics in Figures 1 to 6 are obtained using <300µs pulses, duty cycle 0.5% max.

F. These curves are based on the junction-to-case thermal impedance which is measured with the device mounted to a large heatsink, assuming a maximum junction temperature of T<sub>J(MAX)</sub>=175° C. The SOA curve provides a single pulse rating.

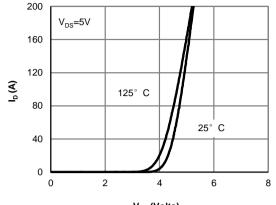

G. These tests are performed with the device mounted on 1 in<sup>2</sup> FR-4 board with 2oz. Copper, in a still air environment with T<sub>A</sub>=25° C.
