A. The value of R<sub>BJA</sub> is measured with the device mounted on 1in<sup>2</sup> FR-4 board with 2oz. Copper, in a still air environment with T<sub>A</sub> =25° C. The Power dissipation P<sub>DSM</sub> is based on R <sub>8JA</sub> t≤ 10s and the maximum allowed junction temperature of 150° C. The value in any given application depends on the user's specific board design.

B. The power dissipation  $P_D$  is based on  $T_{J(MAX)}$ =150° C, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heatsinking is used.

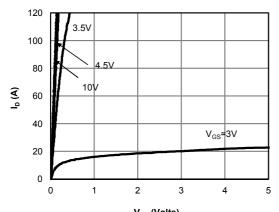

C. Single pulse width limited by junction temperature  $T_{J(\text{MAX})}\text{=}150^{\circ}\,$  C.

D. The  $R_{\text{NJA}}$  is the sum of the thermal impedance from junction to case  $R_{\text{NJC}}$  and case to ambient. E. The static characteristics in Figures 1 to 6 are obtained using <300 $\mu$ s pulses, duty cycle 0.5% max. F. These curves are based on the junction-to-case thermal impedance which is measured with the device mounted to a large heatsink, assuming a maximum junction temperature of  $T_{J(MAX)}$ =150° C. The SOA curve provides a single pulse rating. G. The maximum current rating is package limited.

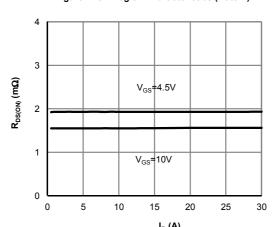

H. These tests are performed with the device mounted on 1 in<sup>2</sup> FR-4 board with 2oz. Copper, in a still air environment with T<sub>A</sub>=25° C.
